Final Review in Brussels

In November 2017 ACCEPT project went through its final review by the EU Commission, so that the ACCEPT partners came together to Brussels for this occasion. The consortium presented the final results of the project with the clear objective to demonstrate the full potential of the system to the reviewers. For this reason, the consortium decided to show the integrated functionalities of the ACCEPT system by simulating a real-life scenario in the presentation room, which represented a big challenge for the team. In order to prepare the necessary digital information and visual assets, the user partners from Belgium (EJD) visited the room in advance and created a 2D plan of the meeting room, using the scanner functionality of ACCEPT.

After that, the floor plan was transformed in a BIM model with integrated metadata for all the building components and exported to the system server, namely the Visual Wiki, using the special plugin developed in the scope of the project by CYPE. The presentation started with the technical demo. During the demo, the system and all related functionalities worked flawlessly, with great satisfaction of the experts and meeting the consortium expectations. The results gave evidence to the importance of such a tool for the Construction Quality assessment, so that the reviewers were convinced of the great potentials of this tool. Overall, the feedback received by the reviewers was very positive. Looking back over the past three years of the project duration, we can safely say that this has been a very exciting and

fruitful project for us. Fraunhofer Italia will continue the development of the built-up methodologies for the coordination and the improvement of construction processes in combination with ICT in future research projects and use the gained expertise within his own services and courses.
